

Risk Analysis Project (2026)

Project Definition

Web program based on Javascript for the frontend and Python for the backend.

Main narrative

To create a risk model to estimate the **economic severance** (economic damage level) of traffic accidents using real data (from real CSV archives).

Example: The desired output would be "The worst 5% of accidents cost more than X\$"

The focus of traffic accidents is related to motorbikes (**Study Location of traffic accident scenarios is yet pendant to choose**).

Data to look for

Column 1	Column 2	Column 3	Column 4
id_event	amount (cost, value, loss)	date (optional)	category

Conditions:

- Cost must be in dollars.
- It should count the number of damages (for a certain period of time, such as a month or semester).
- It should count temperatures of location in Celcius degrees and waiting time in minutes.
